

PROJECT UPDATE REPORT

Name : Md. Abu Sufian Protik (2312234042)

Week 1 (January 22 – January 28)

In the first week we formed a group of 4 members. We are:

- Md. Abu Sufian Protik
- Shahriar Swanon,
- Md. Faiaz Bin Hayder,
- Khandakar Atikur Ahsan.

Week 2 (January 29 – February 4)

During the second week, our team finally decided on our project. We chose to build an image classification model that can recognize five different animals: dogs, cows, cats, lambs, and zebras. For each category, we plan to collect 100 images either from the internet or by taking pictures ourselves. Our goal is to develop a model that can accurately classify these animals with at least 90% accuracy.

Week 3 (February 5 – February 11)

To be honest, I had no clue how to actually build an image classification model. So this week I dedicated my time to learning the basics. I watched YouTube tutorials, read through Google searches, and even asked ChatGPT for guidance. I wanted to understand what steps are involved and what tools I would need before jumping into coding.

Week 4 (February 12 – February 18)

I couldn't make any progress this week because of the National election holiday. I took a complete break from the project and didn't work on anything related to it.

Week 5 (February 19 – February 25)

This week I finally started working on the dataset. I began by collecting cow images and managed to gather 101 pictures from various websites. I kept things simple by renaming all the files from 1 to 101 so they would be easy to organize later.

Week 6 (February 26 – March 4)

I caught up with my groupmates this week to see how their dataset collection was going. We shared what we had collected so far and combined all the images. It felt good to see our collective effort coming together.

Week 7 (March 5 – March 11)

I spent this week really trying to understand how to move forward with the technical part. I watched more detailed tutorials on image classification and learned about different pre-trained models like VGG16 and ResNet. I also figured out how Google Colab works and how to make use of its GPU for faster training. By the end of the week, I had a much clearer idea of what I needed to do.

Week 8 (March 12 – March 15)

This week I finally started setting things up. I opened Google Colab, switched to Python 3 runtime, and enabled the T4 GPU so training would be faster. I cloned our GitHub repository that contains the animal dataset and organized all the images into separate folders for each class. I also mounted my Google Drive so that any files I create won't disappear when I close the notebook. Everything is now ready to start building the model.
